

Kynlet shows what became wrong when a product decision changed.

A tool concept for small software teams. Making downstream impact visible earlier — before teams build further on assumptions that no longer apply.

Conceptual illustration — not a product screenshot

Kynlet aims to surface this at the moment the decision changes.

❏ Kynlet is not a replacement for Linear, GitHub, Notion, or Jira. It addresses a gap those tools do not target.

Why We Think This Problem Matters

The failure is rarely the decision itself. It is the work that continues on assumptions that have already changed — what we call **stale-context execution**. A team changes direction, but the downstream work carries on uninterrupted, disconnected from the new reality.

Engineers building toward an outdated spec

A scope change is agreed in a planning session. Engineering continues building toward the original specification because the change was never propagated to active work items.

Designers refining a removed workflow

A feature is cut from the roadmap. Design continues iterating on its interface — spending days refining something that will not ship.

Sprint plans running on dead assumptions

A pricing or positioning change alters what the product needs to do. The sprint plan, written before the change, continues executing on the previous assumptions without adjustment.

 We believe this problem intensifies as teams increase delivery speed — though this has not been independently measured by us.

Our Current Thesis

We are testing whether decision-change propagation is a meaningful missing capability for small SaaS teams. Everything below is a working assumption, not a validated conclusion.

Our Positioning Assumption

Our current working assumption is that existing tools store decisions or track work, but do not make the downstream impact of a changed decision sufficiently visible for small SaaS teams.

This has not been independently verified against competitor products.

What Is an Impact Set?

When a decision changes, an impact set is the collection of work, plans, and assumptions that were built on that decision — and that may now be built on assumptions that no longer apply.

**Decision
Changes**

**Work
Affected**

**Team Re-
checks**

Conceptual illustration — not a product screenshot

📌 **Ideal Customer Profile (ICP):** Technical founders and CTOs at post-MVP B2B SaaS companies of roughly 8–20 people. *Defined internally. Not externally validated.*

What We Know vs. What We Are Testing

What We Know Today

- **Problem framing documented** — the stale-context execution hypothesis is written, structured, and internally reviewed.
- **ICP documented** — target profile defined internally across firmographic and behavioural dimensions.
- **Validation system ready** — the validation infrastructure exists, has been reviewed, and is ready to run.
- **No sufficient external evidence yet** — outreach has begun; no conclusions have been drawn.

What We Are Testing

- **Problem frequency** — how often does stale-context execution occur in practice?
- **Pain intensity** — when it happens, how much does it cost the team?
- **Willingness to pay** — is this a pain teams would pay to reduce?
- **Impact-set concept** — is the concept recognisable and useful to practitioners?
- **Wizard-of-Oz sessions** — do structured demonstrations of the impact-set concept surface genuine signal (a test of concept utility, not problem existence)?

What Would Change Our Thinking?

Founders do not recognise the problem

Examples are rare in practice

Existing workflows solve enough of it

Willingness to pay is weak

Wizard-of-Oz sessions provide little value

AS OF JUNE 2026

Current Company State

A transparent snapshot of where Kynlet stands today. No inferences should be drawn beyond what is stated here.

Dimension	Current Status
Stage	Pre-seed, founder-led validation
Product	Concept defined — not built
Validation	Infrastructure ready; external evidence collection beginning
ICP	Defined internally — not validated externally
Revenue	None
Customers	None
Design Partners	None
Funding	None raised
Team	Two-person founding team with product and engineering experience

 Validation outreach has begun. No results have been collected or interpreted at this stage.

Where Advisors Can Help

We are not asking advisors to validate the thesis. We are asking for help running a better validation process.

Highest Value Now

ICP Sharpening

Challenge or refine our target profile — firmographic, behavioural, or role-based assumptions.

Founder Introductions

Warm introductions to technical founders or CTOs at post-MVP B2B SaaS companies of 8–20 people.

Validation Design

Advice on interview structure, Wizard-of-Oz session design, and signal-vs-noise interpretation.

Problem Pattern Matching

Share observations from your own experience advising teams where work continued on outdated decisions after a pivot or scope change.

Valuable Later

Product Feedback

Once a prototype exists, rigorous critique of concept, structure, and interaction logic.

Fundraising Introductions

Relevant only after Phase 1 produces evidence that supports proceeding. Not needed now.

GTM Strategy

Channel strategy, positioning, and go-to-market design — once the ICP is externally confirmed.

What Success Looks Like

1

Phase 1 • Validation

- Founder interviews to test problem recognition and frequency
- Wizard-of-Oz sessions to test concept utility
- Willingness-to-pay evidence collection
- Design-partner identification

2

Decision Gate

Evidence supports proceeding — or thesis is revised. No intermediate states. No optimistic interpretation.

3

Phase 2 • Conditional

- Prototype development
- Design-partner collaboration
- Evidence-backed fundraising approach

"The shape of Phase 2 will be determined by what Phase 1 reveals. This is a direction, not a commitment."

No revenue projections. No customer projections. No fundraising timeline projections. Phase 2 is contingent on Phase 1 evidence.

This brief is intended for advisor conversations, warm introductions, expert reviews, and design-partner discussions. It is not an investor pitch deck and should not be read as one.
