

A quick note before we talk

Thank you for making time

Genuinely — thank you. You have a lot going on, and the fact that you've carved out time for this conversation means a lot.

Before we speak, I wanted to send something short so you know exactly what to expect. No surprises. No agenda hidden behind a friendly call.

What Kynlet is

Kynlet is an early-stage concept — there is no product yet. We're still in the process of figuring out whether the problem we're solving is real, how widespread it is, and whether our current thinking is anywhere close to right.

The one-line description we keep coming back to:

Kynlet shows what became wrong when a product decision changed.

That's the wedge. Whether it's the right wedge — and whether it resonates with people like you — is part of what we're trying to learn.

Why we reached out to you

We're talking to technical founders and CTOs who have shipped products at pace — people who've had to make fast decisions with incomplete information and then lived with the consequences of those decisions downstream.

You came up as someone whose experience seemed directly relevant to what we're exploring. That's the honest reason. There's no other angle.

What we are trying to learn

We're not trying to validate a solution. We're trying to understand whether the problem is real. These are the questions we're genuinely sitting with:

- When a product decision turns out to have been wrong, how do you find out? How long does it take?
- Is the gap between making a decision and understanding its impact something that causes real pain — or is it just accepted as part of the job?
- When something breaks or degrades after a change, what does the process of figuring out why actually look like in practice?
- Are there tools or workflows you've built or adopted specifically to close that gap — and if so, what made you reach for them?
- Is this a problem you'd pay to solve, or is it something you'd rather just hire around?

These are hypotheses dressed as questions. We might be completely wrong about the framing. That's fine — and honestly, that's the point of the conversation.

What happens during the conversation

30–45 minutes That's the full length. We'll respect it. If we finish early, we finish early.	No preparation required Please don't prepare anything. No slides, no notes, no thinking about it in advance. We want your honest, unfiltered experience — not a polished answer.
No product demo We won't be showing you anything. This is not a demo call dressed up as a research call.	No sales pitch We are not trying to sell you anything. Not now, not at the end of the call, and not in a follow-up email.

The format is simple: I'll ask questions, you'll talk about your experience, and I'll listen. That's it.

What we do with what you share

A few things worth being transparent about:

- **Notes may be taken** during or after the call. These are for internal use only — to help us identify patterns across conversations.
- **This is validation research only.** What you share will inform how we think about the problem and whether we're building the right thing. It won't be used for anything else.
- **No public quotes without explicit permission.** If we ever want to reference something you said — in any public or semi-public context — we'll ask you first, specifically, and you can say no.

You're not signing up for anything by having this conversation. There's no implied commitment on either side.

One last thing

I want to be honest about where we are: we might be building something that doesn't need to exist. The problem might be smaller than we think, or already solved well enough by existing tools, or simply not painful enough for people to care about.

The only way to find out is to talk to people who would know — and to actually listen, rather than pitch.

So that's what this is. A genuine attempt to learn whether we're wrong.

I'm looking forward to the conversation.

— Alex, Kynlet
